Study: Energy Efficiency Could Save Wyoming Consumers \$900 Million

CHEYENNE, WY--Utility programs that save energy could create an economic windfall of \$900 million for Wyoming, according to a major new study.

The study, *The \$20 Billion Bonanza: Best Practice Utility Energy Efficiency Programs and Their Benefits for the Southwest*, was released today by the Southwest Energy Efficiency Project based in Colorado. The report shows that every dollar invested in energy efficiency programs returns more than two dollars in savings on business and household utility bills in the southwest, including the equality state. It is available along with state-by-state findings at www.20BillionBonanza.com.

“By scaling up energy efficiency programs, utilities serving Wyoming can avoid spending over \$1.5 billion constructing and operating power plants,” said Howard Geller, executive director of SWEEP and principal author of the report. “Helping households and businesses save energy is the lowest cost, cleanest and least risky resource available to utilities today. All utilities should implement Best Practice efficiency programs.”

These programs would educate Wyoming utility customers, offer technical assistance, and provide financial incentives.

Geller said that 610 new jobs would be created in Wyoming by 2020 if all utilities serving the state fully implement such programs and measures.

The report finds that it is feasible to achieve a 15% reduction in electricity by the year 2020 from energy efficiency programs implemented 2010-2020. Reaching the target would save the equivalent of electricity used by 240,000 typical households in Wyoming and require an investment of \$1.1 billion. The investment would be split between utilities and their customers and yield a resulting savings on energy purchases along with public health benefits of \$2 billion—or a net savings of \$900 million for the state’s ratepayers, the study concluded.

“Beyond the financial return, there are other major benefits of saving energy,” said Geller. “One of the biggest is that utilities can retire older, dirtier power plants without compromising their ability to provide safe, dependable power to customers. Closing old plants improves public health by significantly reducing air pollution.”

Other benefits he cited if Wyoming utilities implement Best Practice efficiency programs:

- Avoid or close 2.4 large power plants in the region
- Reduce CO2 emissions from power plants equivalent to taking 690,000 passenger vehicles off the road by 2020.
- Save 1.8 billion gallons of water per year by 2020 through less power plant operation

The report identifies the most effective utility energy efficiency programs across the country and analyzes the costs and benefits of implementing these programs in the southwestern states of Arizona, Colorado, Nevada, New Mexico, Utah and Wyoming. The report includes descriptions of the programs, state-by-state analysis, and a roadmap that policymakers can follow to achieve the 15% energy savings goal and benefits by 2020.

“Policy reform is critical to realizing the \$900 million bonanza for Wyoming,” Geller said.

The report notes that energy efficiency efforts are modest to date in Wyoming. It recommends that the state’s Public Service Commission adopt energy savings goals and allow

utilities in Wyoming to earn a profit when they implement effective energy efficiency programs for their customers.

The Southwest Energy Efficiency Project is a public policy organization that promotes greater energy efficiency in the southwest. For more information: www.swenergy.org.
